AIRBUS
Environmental Innovations

Innovation is the driving force of Airbus, and more than ever is providing the solutions for aviation's sustainable future with the least possible impact on the environment.

At Airbus we invest over 2 billion euros each year in Research and Development; most of this investment is used towards finding the innovative and intelligent solutions that will ensure the maximum environmental benefits from our products.

It's clear that aviation is crucial to the global economy, not only providing the connections for the world's marketplace, but supporting over 56.6 million jobs across the globe. As aviation grows to meet the travel needs and business demands of people all over the world, Airbus aims to provide the top performing aircraft and services to meet both those needs and the targets we have set ourselves to reduce noise and emissions over the years to come.

To meet our goals, we are looking at the whole lifecycle of our aircraft; from design to manufacture, in flight operations to end-of-life as well as the whole supply chain. At each stage in the life of an aircraft we are finding the solutions to improve our environmental performance. Airbus is the first aircraft manufacturer to have a global ISO14001 certification covering its sites, products and services.

We don't have all the answers and there are many challenges ahead but we are committed to continuously improve and we believe that innovation is the key.
