

A400M (Filton)

The A400M is a large, modern and flexible military aircraft, specifically designed for today and tomorrow's military requirements. First flight is due in 2009 where it will start to demonstrate it's capability to travel further and faster with a larger payload. It is a multi-role transporter which is economical to operate, and which exploits the benefits of state-of-the-art technology. The A400M project is truly unique in that it is the first purpose built military project for Airbus and our first wing made primarily using carbon fibre. As a result the demanding manufacturing requirements have been met by some exceptionally revolutionary solutions.

The A400M project offers many opportunities as it enables you to be a part of full wing manufacture at one site. It gives you the chance to be involved in an exciting new project that marks a new era of manufacturing at Filton.
