## Subject: Airbus Aircraft Data for Visual Aids Calibration

## Objective:

This document is aimed at providing aircraft data used for airport visual aids calibration (mainly PAPI, Precision Approach Path Indicator).

It shall be noted that the values at threshold can differ from the below values. The present values cannot be used for determining the approach minima category.

For any question, please contact airport operations department
airport.compatibility@airbus.com

H is the ILS-beam-to-wheel-path height; EWPH or H 1 is the eye-path-to-wheel-path height. H 4 is the Pilot's eye above wheels height.

The values $\mathrm{H}, \mathrm{H} 1$ and H 4 are calculated from the following formulas:
H = D. $\cos \rho+$ C. $\sin \rho+[\text { C. } \cos \rho-\text { D. } \sin \rho]^{*} \tan \theta$
$H 1=B \cdot \cos \rho+A \cdot \sin \rho+[A \cdot \cos \rho-B \cdot \sin \rho]^{*} \tan \theta$
$\mathrm{H} 4=\mathrm{B} \cdot \cos \rho+\mathrm{A} \cdot \sin \rho$
Normal landing configuration is considered for calculations: Standard glidepath angle $\theta$ of 3 degrees, Maximum landing weight, $\mathrm{V}_{\text {REF }}+5 \mathrm{kts}$, Configuration Full, CG 30\%.

| Aircraft | $\mathbf{H}$ |  | H1 |  | H4 |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| A318-100 | (m) | $(\mathrm{ft})$ | $(\mathrm{m})$ | $(\mathrm{ft})$ | $(\mathrm{m})$ | $(\mathrm{ft})$ |
| A319-100 | 4.67 | 15.3 | 6.52 | 21.4 | 5.86 | 19.2 |
